

C

“What’s the worst a function can do that takes a **void *** and returns a **void ***?”

```
1 void * id(void * x) {  
2     strcpy((char *) x, "Bye, bye, data!");  
3     strcpy((char *) &x, "Bye, bye, stack!");  
4     return (void *) rand();  
5 }
```
